* **Layer Masking***. You can limit edits to the parts you want to keep by using the layer masks feature. When you use this, you can see how the edits are affecting the image by using the mask's transparent portion (called a `_layer mask_`) as a mask over areas you want to leave untouched. Instead of choosing the Edit→Transform→Paste shortcut command, Photoshop provides a separate Paste option. Simply select Paste from the shortcut menu (or press Ctrl+V or F5) and choose either the Content-Aware (Upper Right) or Color Replacement (Upper Left) options. After you make your edits, you can save your image as a JPEG if you choose File→Save. You'll probably need to convert the file to edit again if you decide to make any further changes. * **Color***. You can choose any color you want from an image by using the Color button on the Color panel. You can also adjust the color of individual pixels on a background layer. You can use the Quick Color button to access the color palettes in the upper-left corner, and the Paint Bucket tool (the round one that lets you paint in a color) to pick up any color at the

current layer's active position. You can also select a color from an image by choosing Edit→Adjust Colors. Each version of Photoshop, beginning with CS3 and ending with CS6, includes higher-powered features than the previous version did. When you upgrade Photoshop, you automatically receive the more powerful features from the previous version, as well as the new version. You won't need to purchase anything else, although you can create collections of tools and presets (called `_libraries_`) that you can save.

****Live Blending****. The Live Blending options on the flyover panel (Figure 13-12) let you choose the blending modes for an image, including an option to choose one of the eight in-depth blending modes. Of course, you can also create your own. When you have a layer selected (such as the Background layer or a layer with the Quick Selection tool), you can use the blend modes (among other things) to adjust the transition between the foreground color and the background color, creating a stunning filter effect. The Blend Navigator tool (refer to Figure 13-12) lets you experiment with various styles of blending. To access the blend modes, choose Layer→Blend or press the B key

Fertility preservation strategies for male and female cancer survivors who use or wish to use assisted reproductive technologies. The patients who have gynecologic or male cancer, whose treatment causes high-risk infertility, and who use or wish to use assisted reproductive technologies (ARTs) are the target population for fertility preservation (FP). This review summarizes the currently available methods of FP for these survivors and their application to clinical practice. The medical literature on the current strategies available for FP of male and female cancer survivors is reviewed. The main forms of FP available for the male cancer survivor include sperm cryopreservation, testicular sperm extraction, and testicular and epididymal sperm retrieval. For the female cancer survivor, oocyte cryopreservation may offer the most applicable and practical method. Both of these can be used before cancer therapy to allow potential use in the future and have been shown to be successful in cancer survivors, leading to live births. The selection of FP method depends on age, cancer type, cancer stage, other co-morbidities, the patient's age, and the patient's desire to have children in the future. This review discusses and presents the currently available methods of FP for cancer survivors, including in vitro fertilization. It is important to note that FP is a subject with a very large range of practice styles, medications, and surgical procedures, and a well-defined set of outcomes. Cancer survivors who are considering FP should be directed to infertility specialists experienced with the full range of FP procedures.

This disclosure relates generally to the operation of data processing systems, and more specifically, to the ability to perform secure input/output operation in a non-secure data processing system. Related Art At present, most servers in use in enterprises and service providers are based on an operating system from one of three vendors: Microsoft, Red Hat, and SUSE. Each vendor of operating

systems provides a secure mode that is used to transport data between two systems running the operating system. This secure mode is also commonly used to communicate with various components in the operating system. For example, a remote computer may be in a trusted environment that can communicate with one or more secure devices in the secure mode without a security issue. Consequently, it may be possible to program a component in the trusted environment to receive the operating system's secure mode and transmit and receive data to and from the secure mode in a non-secure environment. Furthermore, this secure mode can be used to transmit and receive data and various types of user input. For example

Q: How do you calculate the luminosity of a light source? In a lecture I watched recently, the lecturer defined the luminosity of a light source like this: $L = E / A$ Where E is the energy and A is the area of the source. How does one calculate this? If the area is 1m^2 , how does one calculate the energy? A: This is a very tricky question, but in general you can calculate energy directly from angular frequency ω : $E = \frac{1}{2} \hbar \omega^2$ where \hbar is Planck's constant. This allows us to calculate luminosity of a single source: $\text{luminosity} = \frac{\text{energy} \times \text{frequency}}{\text{area}} = \frac{\hbar \omega^2 \times \text{area}}{2 \times \text{area}}$ To find luminosity for multiple sources you can use: $\text{luminosity} = \frac{1}{\text{time}} \times \text{area} \times \text{number}$ A: To start with, let's just define some terms: $S = \frac{E}{A}$ is the Power Density. $G = \frac{\text{luminosity}}{\text{time}}$ is the Gratings Factor. A is the area of the source, in m^2 . ω is angular frequency in rad/s. $G \propto \text{luminosity} \times \omega$ Now, to solve for luminosity: $\text{luminosity} \propto \frac{\omega}{\text{time}} \times \text{area}$

$\times \text{number} \times \text{luminosity} =$
 $\frac{\text{time}}{\text{area}} \times \text{number} \times \text{luminosity}$
 $\propto \text{frequency} \times \text{area} \times \text{number}$ So, what
 is S ? $S = \frac{E}{A} \propto \frac{E}{\text{area}} \propto \frac{\text{text}}$
