The cad design software features vector and raster graphics drawing, shape manipulation, dimensional measurement, and a suite of drawing and design tools that are suited for architectural, mechanical, electrical, and civil engineers, as well as landscape designers, architects, and industrial designers. AutoCAD is one of the world's leading, most widely used, and fastest growing CAD applications in a variety of industries, including transportation, mechanical, architectural, architectural-engineering, construction, and engineering. The Adobe Suite (PS, AI, and CS) is a collection of software products that includes Adobe Photoshop, Adobe Illustrator, and Adobe InDesign, designed to help users create digital illustrations and print designs. It is owned by Adobe Systems, Inc. and is generally used to create logos, illustrations, and digital publications such as books, newsletters, magazines, flyers, business cards, banners, packaging, brochures, and other marketing materials. Vector graphics are composed of shapes, lines, curves, paths, and fills. Each geometric element can be manipulated independently of the other elements. The elements are scaled together or scaled separately. An important part of AutoCAD is the notion of parametric modeling. The ability to dynamically change and edit the geometric shapes in an application, even while viewing them in 3D, is the feature that separates AutoCAD from the other CAD programs. You can use this feature to create a model of anything — from a light fixture to a boat hull to a home. AutoCAD also features parametric design. This enables a designer to change, edit, and update a drawing at any time during the process. The parametric model contains all the critical information necessary to create the designed part and the drawing can be generated and printed at any stage of the design process. CAD files are text files containing information describing geometric shapes. The 3D CAD representation of the design consists of three types of files: Topographical (TS) data are generated from the CAD model and used for GIS purposes. The TS files will contain the “boundary” information — the edges, faces, and vertices of the CAD model. Hyperlinked CAD model (CH) files contain the representation of the CAD model. CH files will contain the coordinate information (x, y, z) of each vertex, edge, face, and region. DS (data) files are created from the 3D model. Data from the DS files can be imported into other
