A histochemical study of the staining of the connective tissue components of the acromioclavicular joint in vitro. The three components of the normal human acromioclavicular joint, the capsule, the ligament, and the meniscus, were studied in vitro by light and electron microscopy after staining with hematoxylin-eosin and specific stains for connective tissue components. The capsule, the ligament, and the meniscus showed a brown staining with hematoxylin and eosin, particularly in the deeper layers of the capsule, the ligament, and the meniscus. These histological findings suggest that the brown stain was related to the fibrous tissue components of the capsule, the ligament, and the meniscus.
