The effect of 1D confinement on the transition can be obtained by measuring the Mott gap \$\Delta\_{xy}\$ along the \$x\$-\$y\$ direction[@vishwanath large 2013]. While this parameter is of interest, the density \$n {xy}\$ is the quantity that is directly related to the number of carriers per unit area. Therefore, the dependence of \$\Delta {xy}\$ on the scattering rate \$\tau\$ is not as direct as that on \$n {xy}\$. By contrast, \$\Delta {xy}\$ does depend on \$n {xy}\$ because the coupling between the transverse channels plays a crucial role in the experiment. ![\[MCD\](Color online) Normalized conductivity \$\sigma {xy}\$ in different scattering regimes (high-density systems \$\alpha=0.5\$, dashed line; middle-density systems \$0.11\$ the system is two-dimensional and has parabolic dispersion, while for \$n {xy} d0c515b9f4
