Scanner . . I don't mean the aspect ratio. After using this software once and getting used to how it worked, in the process of scanning a large quantity of documents I noticed that no watermark or signature was appearing. In fact I don't recall any instruction manual telling you how to do that. You'll just have to visit the tutorial tab, select watermark or signature and change the settings accordingly. I.e. what your phone is doing is scan a photo, store it as a JPEG and change the format to PDF. You can then add the PDF file to e.g. "Evernote". That being said, as far as correcting the aspect ratio is concerned, you can do this from the "aspect" tab. Watch out though, because the software only allows you to scale the width of the document and doesn't allow you to scale the height. As an alternative, if you have a tablet with a larger screen size you could "print" the file in a PDF that fills the entire screen.

Alcoa May Want to Get Back into the Anodizing Business posted by Dave Basner - Apr 14, 2018 The aluminum giant, Alcoa (NYSE: AA) has a treat for fans of matte black. They may be able to reverse engineer the process of applying coats of anodizing to exterior surfaces of cars and trucks. That's the thinking of a researcher at the University of Alabama who said they developed a process that is simpler and safer than the way things are done today. The problem Alcoa is looking at is that its aluminum parts are currently coated with the anodizing process, but the company would like to get back to the days when an exterior was only decorated in black. Exterior surfaces can actually be anodized or painted in a number of colors, but the anodizing process that Alcoa uses involves the application of an alkaline bath to the surface being coated and the use of a chemical process to tie up the aluminum oxide. This chemical process is far from perfect. It can only be performed when the surface is largely clean, which means that the surface needs to have recently been cleaned, stripped, and sanded, the Professor noted. The dark layer of anodization is actually colored by other materials the car or truck came in

contact with before the anodized surface was applied. With a few other chemical changes involved
