* With Photoshop, you can edit text, color, and shape layers, combine two images into one, sharpen an image, create a collage, and clean images. * Photoshop also has a collection of powerful filters, which can be used to enhance an image. Filters include oil, pencil, landscape, and a host of others. * Because the name "Photoshop" suggests a product, you can buy various services from companies who can save your time by retouching your images for you. * There are a variety of other image-editing programs in the world, and many are free. Both Adobe Photoshop and Corel Paint Shop Pro 11 have a huge amount of functionality, and are often used to help other programs store and print images. They are, however, much more expensive than the Photoshop Corel program. ## Using Special Effects You can use special effects to affect the appearance of a picture or design, helping you make things pop or focus attention. See Figure 12-11 for a couple of examples. Photoshop gives you the ability to generate and apply special effects to images. Even people who are not expert at editing still find the process of generating and applying the effects simple. The effects and filters in Photoshop work to a certain extent on almost any type of image or piece of art, from the simplest graphic to a complex photograph. The tools are designed to work with a single image, but a Photoshop-savvy user can work with layers as well. Creating layers can help you work with an image or picture in many different ways. Figure 12-11: Advanced special effects can add a whole new look to your images.

Q: How do I convert / change the content of a BinaryExpression object in Infer.NET? I'm trying to change the properties of the left-hand object of a BinaryExpression to be the same as the right-hand object of the BinaryExpression. I currently have two classes, House and AdjacentHouse. Their relationship is that an AdjacentHouse is adjacent to a House. The problem is that I want to get the position of a House from the house object, and the position of the Houses from the AdjacentHouse object. I need to then calculate the distance between the house and the adjacent house, and multiply that distance by a given amount. I have most of the logic in place to calculate the distance between the two properties, but my problem is that I'm not sure how to modify the property of the BinaryExpression left object. Here is my code for the distance function: `var member = this.Houses.First().Position; //nested query just to get the house position`
`var memberName = this.Houses.First().HouseName;`
`var otherMember = this.AdjacentHouses.First().Position;`
`var otherMemberName = this.AdjacentHouses.First().HouseName;`
`var result = 0;`
`foreach (var e in this.Houses) { var x = Math.Abs(this.Houses.First().Position.X - otherMember.X); var y = Math.Abs(this.Houses.First().Position.Y - otherMember.Y); var z = Math.Abs(this.Houses.First().Position.Z - otherMember.Z);`
`var Distance = z - x - y; result += Distance * multiplier; }`
I have an auxiliary class HouseAdjacentTo, which the house object references. The HouseAdjacentTo class has the following: Position: the house's position AdjacentTo: references to the adjacents houses Houses: reference to the houses list in my application AdjacentHouses: reference to the list of houses adjacent to the house I'm looking for a way to change the value of this.AdjacentHouses.First().Position. I've tried the following: `var temp = this`
