I am a member of the Monterey Bay Aquarium Research Institute and have a copy of this book. I like it. Resources and Applications of Remote Sensing, Band I: General, 4th ed. Book Chapter: Remote Sensing of the Environment An Earth Resource Perspective For the past 50 years, the oil industry has been using remote sensing to collect and study information, which is referred to as a seismic image, is used to estimate how much oil is present and where, based on the structure of the rock, the oil is likely to be located. The image is created by performing seismic vibrations at the surface of the earth, and measuring the backscattered waves. Much seismic data is collected using seismic "streamers," which are elongated pipes that contain explosives. As the streamers are placed vertically into the earth, a large number of seismic vibrations can be created in a relatively small area. These vibrations are created and detected by seismic receivers and recorded on a seismic data to learn about the structure of the earth's surface. Oil geologists determine the likely locations of oil deposits in the earth using the analysis of the data. The process of studying the seismic interpretation" or "seismic imaging." Reflection imaging." Reflection imaging." Reflection imaging." Reflection images are used by engineers to create design plans for the oil wells. 3.
