1. How do I get Photoshop? To get Photoshop, you need to buy it from Adobe. If you are interested in trying the Lite version, you can download it for free at A subscription is required if you want the full, commercial version. If you are a Mac user, you can use the Photoshop Elements version instead. It includes many of the same tools as Photoshop but in a more simplified and easy-to-use package. For more information, visit the Photoshop Elements website at Some Photoshop users have gone to the cheaper, free "Freeware" section at and downloaded the old "GIMP" program. It is easy to use and is a great free alternative to Photoshop. The Photoshop website also has information for those interested in updating the version of Photoshop they have on their computers, as well as the new Adobe Creative

Suite 5, which is a complete set of multimedia tools, including Illustrator, InDesign, Acrobat and Dreamweaver, among others. The Creative Suite 5 is available for Windows, Mac and Linux users. You can learn more at 2. How do I use Photoshop? In the basic installation, Photoshop is used for image creation and image alteration with layers, which are overlays of areas that blend (or composites) together for effect. The program allows photographers to manipulate images and create new images based on adjustments, changes or enhancements. Image manipulation is often accomplished by means of layers. A layer is a section of an image that can be overlapped by other layers, allowing the developer the ability to blend one object over another with a different color, or perhaps create a smooth transition between two layers with one object. Photoshop also makes it easier to correct an image that has been manipulated, as the layers can be altered and the corrected

version saved as a new image. Photoshop also supports video, audio and Flash-based file formats, including MP3 and FLV (for Windows). The program can easily be used to send a document, image, animation or video file to a colleague or even to a web site to send it to the host. It is also a great program for scanning and image editing

I would like to have an alertview pop up after the mouse is moved across the screen for ~2 seconds. It works when the app starts, but when I move the mouse while the alert is there,

it doesn't disappear. I'm not sure if it's a problem with my setup, or if there's a way to make it simply go away. -(void)keyboardWasShown:(NSNotification*)aNotification { NSValue 05a79cecff

Q: Git: Pre-receive hook written in Makefile, then used in.git/hooks/pre-receive I'm trying to write a git pre-receive hook in a Makefile, but I also want to use it in the.git/hooks directory. I'm using a bash script for now, instead of Makefile, but here's my problem: if I put my pre-receive script in the.git/hooks directory, it doesn't work, because it gets executed before each clone, and the result is that all the files are staged before the clone happens. Here's what I have so far, in.git/hooks/pre-receive: #!/bin/sh #echo "Checking for git repo" if [-d "$GIT_DIR"/repo]; then #echo "git exists, doing nothing" else #echo "git doesn't exist" fi And in.git/hooks: #!/bin/sh #echo "Checking for git repo" if [-d "$GIT_DIR"/repo]; then #echo "git exists, doing nothing" # This is the part that fails. It gets executed before each clone, #

meaning that all my files are staged before the clone happens. git add --all. #echo "git add --all" #echo #echo "git commit -m "testing" " --allow-empty #echo "git push -u origin master" #echo "git reset --hard" #echo "git commit -m "testing" " #echo "git push -u origin master" #echo "git reset --hard" else #echo "git doesn't exist" fi EDIT: I've also tried with a different script, in a bash script: #!/bin/bash if! [-d "$GIT_DIR"/repo]; then exit 1 fi #echo "Checking for git repo" if [-d "$GIT_DIR"
