The project, consisting of

845.5 kilometers of bridges and other infrastructure, is situated along the Yangtze River, a 1,300 km long stretch of water that contains more than 60% of China's freshwater resources. Eco-cannon (half-timbered) With the unique characteristic of building the bridges without human labor, also known as "cannon building", the giant eco-cannon measures 256 meters high and 990 meters long, making it the tallest structure in the world. Construction of the Three Gorges Dam is the largest infrastructure project of modern China. The main dams are 184 meters high and 1,072 meters long, and the central unit with a capacity of 1.8 gigawatts is the world's largest power generator. The generating capacity of the whole project is 20 gigawatts. Construction of Three Gorges Dam has had a series of disasters, including the 2008 collapse of a temporary scaffolding structure and the 2011 collapse of a scaffolding tower which killed six workers. Solar panel on the building This structure, by far the biggest and strongest in the world, uses the structural strength of the concrete itself to construct the dam, which is about 1,000 m thick. As a result of the large volume of concrete used in construction, it is the first large scale concrete structure ever to be made completely void of reinforcement, with the exception of the emergency services facility. The Three Gorges Dam is also one of the first large scale dams in the world to use an eco-cannon, or a remote-controlled, unmanned, bulldozer. It was expected to be completed in 2009, but was halted due to a series of environmental issues. Construction was resumed in 2010.Q: Pointer to char array as array I have some code which uses sizeof() to get the length of an array. I need to

modify the code in order to get the length by writing the source code rather than using a pre-defined number of bytes. c6a93da74d
