
PhoenixSidUnpacker [HOT]

phoenix sid unpacker is a decoder for phoenix id's (of the form "01"- "1"- "12"). it allows to extract the raw identifier bytes of the phoenix id from an audio file, preserving the file in its original format. this can be useful in many situations, such as manually examining the sids (and id3 tags) contained in an audio file. the id bytes extracted are then unpacked into a list of sid structures. the list of sids for a given song is added to the internal sid list. in addition, the song is saved as a file with the original filename. phoenix sid unpacker is a tool that removes phoenix security products (notify, threatreporter, monitor, ipw, control, free, any, etc). it saves your time when you are trying to convert a phoenix security software where security suite software is not working. legitimate software, including adobe's creative cloud, rarely have a very strong hash. they all use something similar to the following (the results that appeared on the screen of my attacker machine are in upper case): \$pgp\$wx\$@&sd6h1j|!%\$_k@&ua%dv~%du&tg%s%_t@mw%c7&c8|_^et&s{&%_x{`qhd~hg&dir%q}nm^&cc%sqe,k&%3bzjqs%e&q/}d0x'ja&b_o{h}xuyt'5a&&asr3%vd&@bjws9q_3fl0~%a5&&@s!t'nt'f&dt_e&%5s{!a}{xh%pq\$Kx7!b&bwssnk5u5z\$49&z
