Suppose I'm having a large, frequently updated dataset, and I have a secondary data store that I'll be using for analytics purposes. When I create a query in BigQuery, is there any way to limit it to only a few days worth of data? In my use case, I'll know which days are important when I start, but I'd like to be able to query that secondary store with old data if necessary. At the moment, I'm doing this: SELECT... FROM... WHERE... AND [TIME] BETWEEN TIMESTAMP(CAST("2018-08-20" AS DATE)) AND TIMESTAMP(CURRENT\_DATE) But this will be extremely slow if the secondary data store doesn't have the exact same schema, and I would have to manually update the query as the data changes over time, which gets cumbersome. A: Since BigQuery is a fully managed service, you have to understand that the data is loaded from your data store each day and you are given a free tier for storage and processing power. The fact that you are paying for storage and processing time does not imply you are getting a free tier for the data. That said, there are several ways to manage data loading and processing of that data. If you want to load data into your database, you can easily load a specific number of records. For example, you can use the FASTLOAD or LOAD statement. This will basically load a set of data from BigQuery into your database. You can also use the App Engine Datastore to load data into your database. This is a little more complex but it has the advantage of being very fast. #### What's New in the Liquid Mix HD?

Onyx Audio and Pro Tools have announced the release of Liquid Mix® HD, a new plug-in instrument from the venerable Liquid Mix family. This updated version of the famous VST from Onyx Audio features the same powerful compressor and EQ emulations as its predecessor, but adds a brand new 'free mode' that enables users to explore the original function of Onyx Audio's classic compressors and EQs. Each instance of Liquid Mix HD provides one Compressor and one EQ emulation, selectable from a huge pool of high-quality vintage and modern day classics. There are forty Compressors and twenty EQs available straight out of the box, with some additional emulations available for free online. Additionally, a seven-band 'super EQ' is available as an in-built user-defined control in each instance. The original purpose of this super EQ was to extend the frequency response of a high-pass or low-pass filter by routing audio from either the low or high frequencies, respectively, to the control input. But now, when this function is activated, it behaves much like the preset EQ that you find on an analogue console, giving you full control over the frequency response of the super EQ. Liquid Mix® HD also offers a 'free' mode for all compressors; original compressors with limited or absent controls suddenly become fully featured. Each compressor in this instance is a preset in the main section of the plug-in. The new feature also enables use of over one hundred simultaneous mono instances on a standard HD3 system, which will prove invaluable for large mixes and multitrack projects. Liquid Mix® HD provides an invaluable way to get an in-depth understanding of these classic compressors and EQs, and lets users explore the original function of Onyx Audio's classic compressors and EQs. This is the ultimate starting point for those who want to explore the world of vintage compressors and EQs. Additional features include: \* Compressors: 40 new presets and 80 new presets for free online \* EQs: 20 new presets and 40 new presets for free online \* Support
