Another thing worth mentioning about the digital art creation feature is the way you can make adjustments with the background layers during development. For example, the new Backgrounds in Layers panel, where you can add backing layers with the click of a button. Other tools exist to do this, so some artists may prefer to go with the new option. Besides that, you can use the new presets. It's nice to still have the choice to modify the look of a document's template, too. The sharpness of a JPEG still seems to have some room for improvement, though. Layer Styles can be particularly good for sharpening up photos, but I feel like it would be even better with a real "layer mask" like in Lightroom. Layer masks dull the photo's edges, while Layer Styles can be used to shape the photo from any point. When a photo is contrasted with other ones (a red tone in a blue background, for instance), I would have loved to see real layer masks. Offset Painting, on the other hand, is great for softening up difficult parts of a photo. It's great to have this tool included in Photoshop. Generally, I'm quite happy with Photoshop CC 2014. It just feels "natural" to me, since it has always worked that way. If you're looking for the same features, two that come to mind are the Oil Painting tool (in the Adjustments panel) and the Copy and Paste tool. And it is quite a bit easier to figure out how to work around problems. In my case, I needed to take a section of a check-in-flight-screen PSD and copy it onto a new layer so that I could add a nearly invisible layer that I could later use to shade and layer in hidden graphics. PSD Preview turned out to be a lifesaver as well. The ability to make the now move-on-to-another-page PSD preview a real-time Tetris board is very useful. Who didn't love Tetris?
