One of the enhancements introduced in the latest update is the dedicated camera raw compressor feature called Photoshop Photo Merge. It will morph your supplemental camera raw settings, down to the preset level, and sharpen the image back down. This is not as effective of a process as some, such as Lightroom, which does more complicated things with its own adjustments, but still may be helpful for especially difficult images. Like you have to turn down the Sharpen or Color down to get a more finished effect. The process is easier than before, so it is a plus. You'll get a notification in the upper right-hand corner of the Photoshop window letting you know that a preference has been changed. But before you panic, you can always use the in-context menu in the top menu bar to do something about it. The "Lock" menu item will disable the change and prevent you from accidentally making that change again. While you can force changes using the menu, it's best to let the Preferences panel remind you the often times. It's a very good solution and much easier to use than a cold-fusion tattoo, but it's also possible that it would be ridiculously overkill for most people. Not everyone wants to change their workflow without real reason. The new features–the ability to use keyboard shortcuts, the new way of pasting colors and gradients, and the ability to manage text and color types from the History panel via the Rewrite buttons–all feel like improvements over Photoshop's previous version. But, they're probably best suited for more advanced folks who like to micro-manage their programs.
