So why would I say this? Because of what was done with the new Pencil. To make the Apple Pencil truly useful in Photoshop, Adobe had to go back to the drawing board, as they did before the iPad came out. The previous trackpads and other Apple devices were not Macs or iPads, so what's the point of an Apple Pencil? In that sense, I feel that the Apple Pencil is a brilliant marketing decision: it looks like a real Apple drawing tool (but is also wireless), and because it looks like the edge of a Macbook Pro, it helps the brand with communication. That's a clever marketing move, and I appreciate that iOS engineers did not make a second OS. In terms of a tool, however, I find it to be merely adequate, and certainly not a drawing tool that will affect the way we work on the web. So I think that in the end, we have to admit that the new Apple iPad Pro feels like what it isn't: a completely new computing device with a completely new OS. All Apple seems to care about is how it can work with our existing computers, tablets, and smartphones, and nothing else really matters. iPad Pro is not Mac; it's not a new iPad; the UI is not the same; the OS is not going to be completely re-thought for the iPad Pro, so we have to interact differently with the software. The iPad Pro, having been optimized for touch, seems to focus on small things. In fact, I will say that I really don't want to touch it at all. That may seem a strange thing to say for a device that is kind of a replacement for the iPad, but you must understand that this thing is completely different in terms of usage. Like Apple TV, it is a device that has been totally redesigned for the purpose of being touch-centric, but not really suited for it.

For example, you can unify multiple layers to create a layer group, and simultaneously select and work with the layers of that group. You can define layer properties so that you can keep your work consistent throughout your project. **What It Does:** A selection is a visible range of pixels in a digital image that can be grouped together so they are treated as a single entity. Likewise, a shape can be a contiguous area of pixels defined by a path. A selection or a shape is a composite object with attributes that may be independent of the original pixels in the image. This means the features you add to the object have no impact on the features of the image you selected or shaped. e3d0a04c9c
